

We are experienced in using digital radiographs and computerized imaging. For fillings, we do the new composite fillings because they strengthen the tooth with the new bonding technology and they're more conservative. We have intraoral cameras to help with our diagnosis and to allow you to see what is going on in your mouth. We provide dental implants as a better way to replace missing teeth.

In a world that can be less personal, a healthy relationship between dentist and patient is refreshing. We seek to inform our patients, build trust, and provide attention to every detail so that you can be at ease, knowing that you made an informed decision about your dental care.

New dental patients:

Proper dental care is important at all ages. Good dental health requires that you take care of your teeth daily and have regular dental checkups. The American Dental Association® recommends visiting your dentist regularly for professional cleanings and oral exams. Our office accepts most major insurances.
